

ABSTRACT OF THE DISCLOSURE

A suction or blowing cylinder of a machine used to produce and/or shape paper, cardboard, tissue, or other fibrous material. The cylinder comprises a rotatable perforated cylinder covering and a pressure area. The pressure area is connected to a low pressure source or a high pressure source and is sealed in relation to the cylinder covering by at least one sealing element. The sealing element is flat-shaped and arranged in the vicinity of the inner wall of the cylinder covering.
